**ABSTRACT:** - In this article, the idea of using modern technologies in the process of education of young people and preparing the necessary personnel for our independent Uzbekistan lies

**KEYWORDS:** Education, national personnel training program, modern technologies, teaching methods

### INTRODUCTION

After the Republic of Uzbekistan gained independence, education took one of the central positions in the state policy. This was the basis for the creation of the "Law on Education" and the "National Personnel Training Program". As a result, there was a need for a new project of educational content - the use of advanced pedagogical technologies in the educational process. At the 14th session of the Oliy Majlis, the President of the Republic of Uzbekistan Islam Karimov said that "it is necessary to ensure the timely development and introduction of new textbooks, modern pedagogical and information technologies." It is known that

any pedagogical technology should be based on educational principles that develop a new project of education and should be directed to the personality of the student. At the center of advanced pedagogical technology are the teacher and the student, who are the leader of the educational process and the subject and object of this process. Therefore, the cooperation, mutual communication, and mutual influence of these two persons should be organized on the basis of the most modern and national requirements. To do this, first of all, the teacher must learn the requirements for the educational process, the principles and ways of organizing and managing education, the methods of mental and physical

development of the student, cooperation with him, to direct the learning to the winter, to organize the activity of the student correctly, to communicate with them, to eliminate problems and disagreements, to create a creative and working environment in the classroom, to clearly and correctly organize the activity of the student should be armed with evaluation methods.

Today, the interest and attention to increase the effectiveness of education by using interactive methods (innovative pedagogical and information technologies) in the educational process is increasing day by day. Classes using modern technologies are aimed at students to find the acquired knowledge by themselves, study and analyze it independently, and even draw their own conclusions. In this process, the teacher creates the conditions for the development, formation, learning and upbringing of the individual and the team, as well as performs the role of management and guidance. In such an educational process, the student becomes the main figure.

In order to solve the problems faced by the educational system in the innovative processes taking place at the present time, we need people who are able to absorb new information and evaluate the knowledge they have acquired, who make the necessary decisions, who are independent and think freely. Therefore, the role and importance of modern teaching methods - interactive methods, innovative technologies in the educational process of educational institutions is incomparable. Pedagogical technology and the knowledge and experience of their use in education ensure that students have knowledge and advanced skills. Knowledge of new, advanced pedagogical technologies, including modern interactive methods of teaching, learning, analyzing and summarizing relevant information for the pedagogical staff

of special educational institutions, and being able to apply it in practice is of today's social significance. is a requirement.

There is information on the use of their scientifically based, results-guaranteed forms in the implementation of advanced pedagogical technologies in the educational process at the national level.

In the period of independence in Uzbekistan, a concept of national and continuous education was developed, which expresses the goals of realizing national and universal interests. As a result of its implementation, an educational system was formed that meets the criteria of developed countries in the world. According to it, the process of continuous education throughout a person's life, enriching individual aspects and increasing their potential was defined as a priority task.

Our President evaluates the role of education in the step-by-step development of the republic as follows: "Implementation of deep reforms, transition to a market economy will depend, first of all, on the potential of personnel and their professional readiness. This requires a fundamental reform of the entire educational and cultural system. Because it is knowledge and high culture that allows us to use freedom in the way of everyone's happiness. In previous years, our educational system was separated from the advanced achievements of the world civilization and the historical roots of our people. This situation should be radically changed. In fact, it is necessary to raise a new generation that will absorb the age-old wealth of our people, the best achievements of world science and culture."

As a result of the implementation of the national personnel training program in the country, the training of pedagogical personnel in accordance with modern requirements, the creation of educational standards, the

development of new curricula, the renewal of the structure of general education schools, three-level education (secondary special and vocational educational institutions, vocational college, academic lyceum) to create a foundation for the system, to carry out activities that lay the foundation for the continuous education system, and to guarantee social protection. However, at the same time, the issue of training appropriate pedagogical and management personnel for further improvement and development of this field is still waiting for its solution. Because management personnel in this education need to improve their knowledge in the field of management and marketing of educational services. These conditions are being created to stimulate the work of pedagogues, to improve the efficiency of lesson distribution, to improve the content and quality of education, to adapt it to the requirements of different groups of the population, and to eliminate the problems of bringing educational institutions closer to enterprises that feel the need for personnel.

So, the introduction of innovative changes into the education system continues. At the same time, the rapid development of education in the current period has led to tasks related to innovative processes such as the development of scientific and practical centers in the regions, improvement of educational programs, methodology, educational materials, manuals and educational technologies. is included in the agenda.
